Huawei has announced it is working on a dual Windows Phone-Android-powered smartphone that will be released in the U.S. in the coming months. And a company executive decided to insult Microsoft in the process. The news came via Huawei Chief Marketing Officer Shao Yang, who explained during an interview with TrustedReviews that while the company is committed to Windows Phone, it wants to stick with its Android roots by releasing a device that runs both platforms. MORE: 10 Best Android Apps You're Not Using "If it is Windows only, maybe people will not find it as easy a decision to buy the phone," Yang told TrustedReviews. "If they have the Android and Windows together, you can change it as you wish." While specs are currently unavailable, Huawei's upcoming dual-boot handset is expected to arrive in the U.S. sometime next quarter. The Chinese smartphone maker noted that while Windows Phone isn't a top priority, the brand is still committed to releasing devices based on Microsoft's OS. We've reached out to Microsoft for comment on Huawei's upcoming dual-boot device and the Huawei's none-too-flattering comments, but the company declined. Other manufacturers skittish on Microsoft's operating systems are going the dual-boot route. For example, the upcoming ASUS Transformer Book Duet runs both Windows 8.1 and Android. These no-confidence votes have to be stingy new CEO Satya Nadella. Source: TrustedReviews TAIPEI, Taiwan — Is it a tablet, a mini PC or the second coming of the UMPC (ultra mobile PC)? Whatever you call it, the Gole1 is a truly unique and fascinating device. The \$99 computer runs both Windows 10 and Android 5.1 on its tiny, 5-inch touch screen while providing a wider array of ports than you'll find in most mobile devices three times its size. I got a chance to go hands-on with the Gole1 and was impressed with its extreme versatility. The 0.78-inch thick device has four, full-size USB ports, a full-size HDMI out, a microSD card slot for memory expansion and a microUSB port you can use to charge it (it also has a proprietary power port). There's a Gigabit Ethernet port and 802.11ac Wi-Fi to keep you connected at high speeds. The Gole1's rectangular chassis is made from a very snazzy looking, gold-colored aluminum. In the bottom screen bezel, you'll find a power button, volume rocker and Windows button. The device weighs less than half a pound and feels solid, but more than light enough to carry in one hand or put in a front pocket. The 5-inch display sports a 1280 x 720-pixel (720p) resolution that gives it a very strong pixel density of 293 ppi, far better than most laptops or tablets. While I usually prefer a Windows 10 desktop to have more real estate than 720p allows, you wouldn't want to make any of the icons or text on the screen even smaller. The 5-point capacitive touch panel seemed quite responsive during our brief hands-on. On the inside, the Gole1 has an Intel Atom Cherrytrail Z8300 CPU, 2 or 4GB of RAM and 32 or 64GB of eMMC memory. The \$99 model comes with 2GB of RAM and 32GB of eMMC storage, while the \$129 unit doubles both the RAM and storage memory. We didn't get to benchmark the unit in front of us, but it seemed snappy. The device's built-in battery delivers only around two hours on a charge. However, because it can get power via microUSB, you can attach the Gole1 to any external battery pack and juice it that way. During our hands-on, we had the system attached to an external battery and it worked flawlessly. With all of its power and flexibility, the Gole1 could serve any number of different roles for you. It has enough performance and the necessary HDMI port to make it a set-top box. Because it has 802.11ac Wi-Fi and Windows 10, it should also be able to receive Miracast transmissions, enabling you to mirror the display of a larger device onto your home theater via the Gole1. It can also enable Xbox Live streaming or Steam In-Home Streaming so you can play games from your console or more powerful PC on your TV. The Gole1 can also serve as a regular desktop PC, attaching to a keyboard, mouse and monitor. It almost goes without saying that the Gole1 can be a tablet, due to its built-in touch screen. However, my favorite possible use case for the device involves using it as a mobile server. Just imagine installing the WAMP server software on it and anyone in the area can connect to your Gole1 and surf custom web apps you created. Or picture yourself using the device as a wireless file server to share assets like photos only with those in your immediate vicinity. At only \$99, the Gole1 promises to be one of the best deals in tech. The price is so good that you can buy it now and figure out your use case later. You can purchase the Gole1 from its Indiegogo page, with the first units shipping in the next couple of months. A few early backers can get the 2GB version for just \$89. Republicans are not wild about antitrust enforcement. The US government's two biggest antitrust regulators — FTC chair Lina Khan and Justice Department antitrust chief Jonathan Kanter — appeared for a Senate Oversight hearing on Tuesday, and there were two quick takeaways: 1) Republicans still are eager to notch some kind of win against Khan and the Democratic FTC majority 2) They don't really know how to do it yet. Expect a lot of fireworks here if Republicans take back the Senate majority in November. Snapchat has announced yet another feature as they continue to expand their platform that originally was created to simply send and receive temporary pictures. The new feature is called Memories, and it's essentially a cumulative archive of all of the snaps you've saved to your phone since you downloaded the app. But how exactly do you navigate Snapchat Memories, and how does this new feature work? Here's how to use Snapchat Memories to your fullest advantage. How to access Memories in Snapchat on Android Launch Snapchat from your home screen. Tap on the smaller white circle underneath the shutter button to access Memories. You can also swipe up anywhere on the screen. While tablets such as Apple's iPad and Motorola's Android-based Xoom are continuing to attract popular attention, there are many workplaces that are still based around Microsoft Windows. Unfortunately, Windows 7 isn't really optimized for use in tablets, and it looks like the next version won't be out for another year. So what can people who want to use Windows on a tablet do? ViewSonic ViewPad 10 ViewSonic is hoping to offer businesses a steppingstone with its ViewPad 10 dual-OS tablet. Equipped with both Windows 7 and Android 1.6, it gives companies the flexibility to continue using their existing Windows corporate programs while offering access to Android apps. A good-looking tablet weighing 1.9 lbs. and measuring 0.6 x 10.8 x 6.7 in., the ViewPad is an inch longer and 4 oz. heavier than the Motorola Xoom. Its 9 oz. AC adapter is positively gargantuan compared to the iPad 2's tiny power cube. I like the ViewPad's demure black-and-dull-silver case and its three-button layout. One of the buttons is the power on/off. The second button has a Home icon but actually takes you back one screen at a time in Android mode and works as the Alt-Tab key combination (which shuffles through open windows) in Windows mode. The third, which has an icon that resembles Android's "Go Back" symbol, actually works as a Menu button in Android and turns the Wi-Fi on/off in Windows. The 10-in. display with 1024 x 600 resolution is bright with rich colors; like most tablets, it automatically reorients itself when rotated, although slowly in Windows. It respectfully behind the Xoom and other tablets based on Android 2.0 "Honeycomb," and even older devices that run Android 2.1 or 2.2. Because it's using the ancient Version 1.6, it can't even play YouTube videos. The ViewPad doesn't have access to the Android Market but does include 26 apps, such as the standard Android email app, the iReader and the taskbar. The ViewPad comes equipped with a 1.6GHz Intel Atom N455 single-core processor and 2GB of RAM (as a comparison, the Motorola Xoom comes with a 1GHz Nvidia Tegra 2 dual-core processor and 1GB of RAM). The \$680 model I looked at includes Windows 7 Professional and 32GB of flash storage for programs and data; a 16GB version with Windows 7 Home Premium costs \$50 less. On the left side of the ViewPad is a reasonable assortment of ports: a microSD card slot and a pair of USB ports. The ViewPad lacks the Xoom's HDMI connector, but there's a microUSB port for connecting to a monitor; unfortunately, the adapter cable was not yet available at the time this was written. Connectivity is supplied by 802.11b/g/n Wi-Fi and Bluetooth. I tried it with an Adesso Bluetooth keyboard and Jawbone ERA headset. ViewSonic does not offer a 3G or 4G network data connection option, which both the iPad and Xoom do. Two operating systems in one The ViewPad 10 can be booted up in Windows 7 or Android 1.6. (ViewSonic has promised an Android 2.2 upgrade but hasn't specified when.) Unfortunately, moving between Android and Windows is not an immediate transition, and the interface for choosing the OS is clunky. After you reboot the ViewPad (which takes about a minute), you wait until the two operating systems are listed in small type at the top of the screen. You then use the Home button to move to the Windows selection and hit the Menu key to select it. If you don't do anything in 7 seconds, the system will default to Android. Once it's going, the ViewPad 10 is fine for most business uses in each environment. For Windows use, it comes with Microsoft's basic programs, like Paint and Media Player. However, you'll have to purchase and install your own copy of Microsoft Office; the tablet doesn't even offer a trial version. Just to make sure that I could install common Windows applications, I added Microsoft's downloadable PowerPoint viewer and OpenOffice, which worked fine. As an Android tablet, though, the ViewPad 10 is a definite step backward -- it's missing the Xoom's camera and other features. Aldiko -- reader apps, a PDF viewer and DataViz's Documents To Go for reading and working with Word and Excel files. It all adds up to a tablet that can handle standard business tasks but is a mediocre system. The ViewPad scored an uninspiring 24.3 on PassMark's PerformanceTest 7.0 benchmark suite of Windows-based tests, putting it solidly in the netbook camp as far as performance is concerned. The system's 3,200-milliamp battery was able to play videos from a microSD card for 4 hours 7 minutes in Windows mode and for 3 hours 57 minutes in Android. As the tablet works, the left side heats up, but it never exceeds 100 degrees Fahrenheit. Bottom line: At \$680, the ViewPad 10 is \$80 more than an iPad 2 or Xoom with 32GB of storage and Wi-Fi-only connectivity -- or a 3G Xoom with a two-year contract. It provides an opportunity for firms to protect their investments in Windows software while exploring Android -- but most consumers will probably want to look elsewhere.
